

BACnet and the High Performance Building

BACnet International  Written in conjunction
with BACnet International

Reach 73,000 Commercial and Institutional Building Owners and Facility Executives! July Special Report Sneak Peek

A high performance building is one that delivers top levels of energy efficiency and occupant comfort while the building is in operation, not just in design. A BACnet-based control system that pulls in multiple systems across the building offers powerful tools for achieving that goal. A key set of tools is analytics - software that uses powerful algorithms to analyze massive amounts of data to find operational problems. Analytics can take advantage of BACnet data to show facility executives how their buildings are operating from day to day. This article examines the ways that facility executives can use analytics and other measures to help ensure that high-performance design translates into high performance operation. Topics include:

- BACnet's contribution to achieving a high performance building
- How BACnet-based analytics can help ensure high levels of ongoing performance
- Role of the facility executive
